Mr. Dominico Angelone 287 Union Street Hackensack, NJ 07601

Dear Mr. Angelone:

MAYWOOD SITE -- SURVEY RESULTS FOR 70 WEST HUNTER AVENUE

The purpose of this letter is to forward, per your request, the results of the radiological survey of the subject property. The results of the survey indicate that no radioactive contamination above the Department of Energy's (DOE) guidelines exists at the property. The attached two figures (from the Maywood Remedial Investigation Report, dated December, 1992) show the locations of the survey. Figure 4-38 presents the locations and results (in counts per minute (cpm)) of walkover measurements taken at the property. A measurement of 11,000 cpm is approximately equal to the DOE guideline of 5 picocuries per gram (pCi/g) above background for thorium-232 in surface soils. All measurements are less than 11,000 cpm. Figure 4-39 shows the locations of borehole and surface soil sampling. No radioactive material was detected in the surface and subsurface soil samples above DOE guidelines. Table 1 summarizes the data for the surface and subsurface soil samples.

If you have any additional questions, please contact the Maywood Information Center at (201) 843-7466.

Sincerely,

Susan_M. Cange, Site Manager Former Sites Restoration Division

M. Canz

TABLE 1
Summary of Radiological Data for 70 W. Hunter Ave.

Radionuclide Concentrations in Surface Soil (pCi/g)			Radionuclide Concentrations in Subsurface Soil (pCi/g)		
<3.5 - <7.1	0.4 - 1.2	<0.5 - 3.2	<1.8 - <9.2	0.5 - 1.6	0.7 - 4.4

NOTE: Use of (<) indicates that the radionuclide was not present at concentrations measurable by the instruments or techniques used
